

- An **INCLINED PLANE** is a sloping surface, like a **RAMP**, that reduces the amount of force required to lift an object.

- An inclined plane can be designed to reduce the force needed to lift a weight in two ways: **INCREASE** the length of the ramp or (2) **DECREASE** the height of the ramp.
- By increasing the distance the effort force moves (length of the ramp) relative to the distance the weight is lifted (height of the ramp), an inclined plane can **REDUCE** the effort force needed.
